Database Management Systems

Transactions

Transactions

- How many people are using our database?
 - What problems can arise?

Data Items

- A transaction is a logical grouping of operations.
- What is the piece of data being monitored by a transaction?
 - –A record?
 - –A column?
 - –A page?
- Two basic operations for each item: read and write

Transactions

(a) read_item(X); X := X - N; write_item(X); read_item(Y); Y := Y + N; write_item(Y);

(b) $read_item(X)$; X := X + M; $write_item(X)$;

Lost Update Problem

	<i>T</i> ₁	T ₂
Time	read_item(X); X := X - N; write_item(X); read_item(Y);	read_item(X); X := X + M; write_item(X);
•	Y := Y + N; write_item(Y);	

Temporary Update Problem

<i>T</i> ₁	T ₂
read_item(X); X := X - N; write_item(X);	
	read_item(X); X := X + M; write_item(X);
read_item(Y);	

Time

Incorrect Summary Problem

	\Rightarrow	$\stackrel{\wedge}{\Rightarrow}$	\Diamond
(Alle Alle		
		<u> </u>	

<i>T</i> ₁	T ₃
read_item(X); X := X - N; write_item(X);	sum := 0; $read_item(A);$ sum := sum + A; : : : : : : : : : : : : :
read_item(Y); Y := Y + N;	
write $item(Y)$:	

Unrepeatable Read Problem

- Occurs when same value is read twice, but modified in between
 - We expect the result to be the same for both reads, but it is not

Recovery

- All statements must execute within a transaction
 - Committed
- If a problem occurs that prevents a transaction from completing, we must undo our changes
 - What kinds of problems could occur?

Transaction State

BEGIN TRANSACTION

■ READ OR WRITE

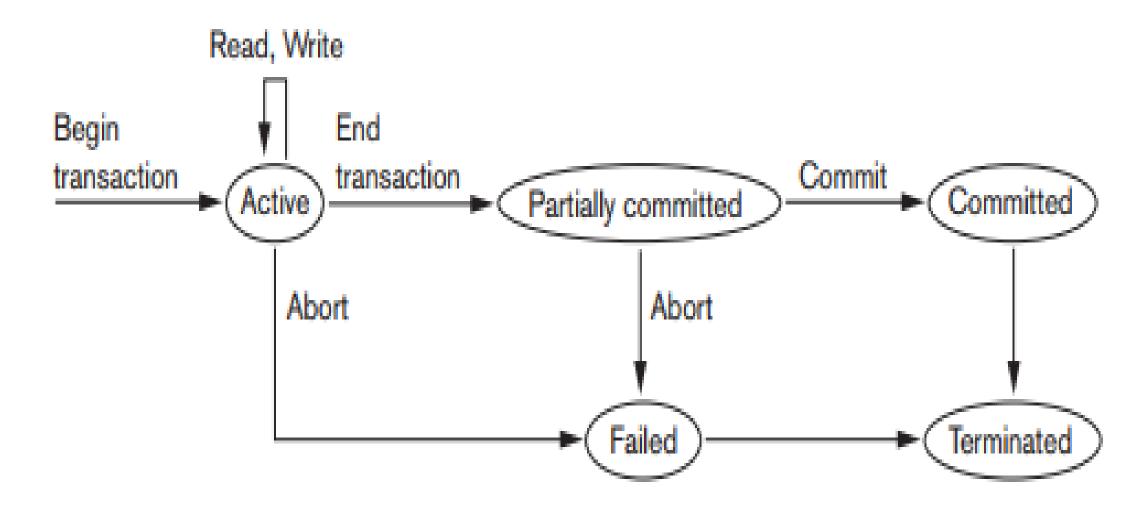

END TRANSACTION

COMMIT TRANSACTION

■ ROLLBACK

Transaction State

Log Files

- Sequential, append only list of transaction states
- Each entry contains:
 - -Transaction ID
 - State
 - Any data modifications that were made
- This log is useful for
 - -ROLLBACK
 - Recovery

Properties of Transactions

- Often called ACID properties:
 - –Atomicity
 - -Consistency Preservation
 - -Isolation
 - –Durability

Schedules

- A schedule is an ordering of the operations within a set of transactions
 - Operations from different transactions can be interleaved
 - Operations from a transaction must show up in the same order in the schedule

- Lost Update Schedule
 - -Sa: r1(X); r2(X); w1(X); r1(Y); w2(X); w1(Y);
- Temporary Update Schedule
 - -Sb: r1(X); w1(X); r2(X); w2(X); r1(Y); a1;

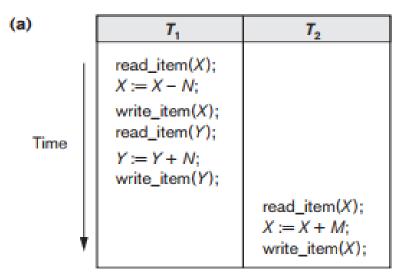

Conflicts

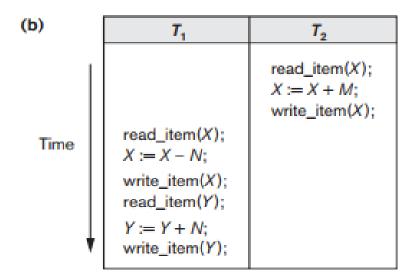

- Operations are said to be in conflict if:
 - -They belong to different transactions
 - -They access the same item
 - -At least one of the operations is a write
- Two types
 - Read/write
 - Write/write
- We must be aware of conflicts when forming schedules

Serial vs. Nonserial Schedules

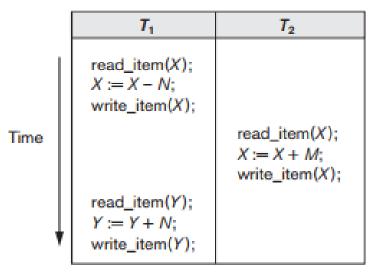

Schedule A

Schedule B

(c)	<i>T</i> ₁	T ₂
	read_item(X); X := X - N;	read_item(X);
Time	write_item(X); read_item(Y);	X := X + M;
	Y := Y + N; write_item(Y);	write_item(X);

Schedule C

Schedule D

Serializable Schedules

- Serial Schedules are considered unnacceptable
 - -Why?
- We wish to use non-serial schedules, but guarantee the same outcome
 - A serializable schedule is any schedule that is equivalent to a serial schedule
 - But what defines equivalence?

Conflict Serializable Test

- For each transaction T_i participating in schedule S, create a node labeled T_i
 in the precedence graph.
- For each case in S where T_j executes a read_item(X) after T_i executes a write_item(X), create an edge (T_i → T_j) in the precedence graph.
- For each case in S where T_j executes a write_item(X) after T_i executes a read_item(X), create an edge (T_i → T_j) in the precedence graph.
- For each case in S where T_j executes a write_item(X) after T_i executes a write_item(X), create an edge (T_i → T_j) in the precedence graph.
- The schedule S is serializable if and only if the precedence graph has no cycles.

Practice Problem

Run the conflict test for each schedule on slide 16

Transactions in SQL

START TRANSACTION

COMMIT

ROLLBACK

ISOLATION LEVEL

Type of Violation

Isolation Level	Dirty Read	Nonrepeatable Read	Phantom
READ UNCOMMITTED	Yes	Yes	Yes
READ COMMITTED	No	Yes	Yes
REPEATABLE READ	No	No	Yes
SERIALIZABLE	No	No	No
